New features

NEW FEATURES

NEW

DD Material Code Tagger

A new render annotation tool for the DD (Design Development) phase. Users can upload a render, click to place draggable material code labels directly on the image, and export an annotated PNG with all codes overlaid.

- Click-to-place annotations with drag-to-reposition support
- Zoom control and adjustable label scale
- Detailed colour mode for label visibility on light/dark renders
- Canvas-based export that bakes annotations into the final image
- Added as a new render mode: *"Material Code Tagger"* in the Workspace

components/features/DDMaterialTagger/AnnotatedRender.tsx

NEW

DD Phase Material Schedule

A full project-level material code library is now embedded in the app, covering all DD phase finish categories with human-readable descriptions.

- Categories: Metal, Tile, Stone, Paint, Laminate, Leather, Fabric, Wallpaper, Glass & Mirror
- Used by the Material Code Tagger for auto-complete when placing annotations

NEW

Google Sheets Material Export API

A new backend endpoint aggregates all placed material annotations, appends AI-generated price estimates, and pushes the result directly to a Google Sheet via the Sheets API.

- Deduplicates annotations by code and counts quantities per room
- Attaches source links and price range estimates
- Uploads an annotated reference image to Google Drive alongside the sheet
- Max execution time: 60 seconds

`app/api/sheets/export/route.ts`**NEW**

3D Model Backup Tab (Google Drive)

The Models tab now includes a dedicated *Backup* tab that lets users upload 3D resource files directly from the browser to a chosen Google Drive folder — bypassing the server to handle large files efficiently.

- Supported types: .jpg, .jpeg, .png, .bmp, .tif, .tiff, .tga, .vrmesh, .ies, .hdr, .tx, .exr
- Inline Drive folder picker with breadcrumb navigation
- Create new subfolders directly from the picker
- Per-file upload progress with error reporting
- Direct browser → Drive upload (no server buffer)

IMPROVEMENTS

IMPROVE

Material Board Image Generation (Imagen)

The PromptGenWorkspace now supports AI-driven material board image generation using Imagen. A reference image can be analysed by Gemini (furniture & plant detection) before passing the description to Imagen to generate flat-lay material board variations.

- Added `singleImage` mode to Imagen API — runs a single prompt as-is instead of splitting into multiple sections
- Added `imageData` pass-through for image-to-image input
- Structured reference analysis prompt extracts chair type, upholstery, plant, and colour story

`app/api/imagen/route.ts``components/features/VizWorkflow/PromptGenWorkspace.tsx`**IMPROVE**

File Browser Overhaul

Significant updates to the FileBrowser component (209 lines changed), improving navigation, display, and interaction for project files within the workspace.

`components/viewers/FileBrowser.tsx`

IMPROVE New /3dmodel App Route

A dedicated /3dmodel page was added as a standalone entry point for the VizWorkflow app, complete with auth guard (login, outsource portal, and access-pending states).

`app/3dmodel/page.tsx`**IMPROVE** Gemini & GPT API Minor Updates

Both the Gemini and GPT route handlers received small updates (13–16 lines each), likely aligned with the new material board and annotation features.

`app/api/gemini/route.ts``app/api/gpt/route.ts`**INFRASTRUCTURE****INFRA** Docker & Cloud Build

- Added .dockerignore to keep image lean
- Updated Dockerfile with 3 new lines (likely new route/module inclusion)
- Updated cloudbuild.yaml with 3 new lines

`Dockerfile``.dockerignore``cloudbuild.yaml`
